

Testing Adjusting Balancing & Ductwork Cleaning

RLGbuilds.com

Testing, adjusting and balancing (TAB) services conducted on HVAC systems ensure optimal operations, without leaks or other mechanical issues.

TAB ensures proper air flow for better air quality and a comfortably conditioned building that achieves energy efficiency for lower costs and a comfortable environment for occupants.

Additionally, GEM Service offers ductwork cleaning, fire and smoke damper inspection as well as repair and cleaning of these systems.

When was the last time your facility's duct work was thoroughly cleaned?

While HVAC filters help keep out major particles, smaller particles of dust and debris can build up in a system, causing not only poor efficiency, but compromised air quality as well.

Duct cleaning is especially important after any construction work has been completed at your facility, but regular cleaning helps to maintain safety and health by reducing dust, mold, allergens, and germs that cause illness.

Important benefits for your facility and business

Having your entire system cleaned and balanced regularly will not only ensure efficient operation, but will also contribute to healthier air quality when coupled with an air purification system. The benefits to your facility include:

- Compliance (labs, hospitals, commercial code, etc.)
- Risk/liability management, avoidance of fines, etc.
- Occupant satisfaction/productivity/health & safety related to Indoor Air Quality (IAQ) optimization
- Reduces/eliminates odors, particulates, microbes
- Minimizes noise
- Potential energy savings
- Can reduce equipment wear-and-tear

The GEM Service TAB team holds Level 1 and Level 2 Life Safety Certifications, is NADCA (duct cleaning) Certified and is equipped with the best tools in the business to ensure your facility's HVAC systems meet all applicable codes and is running at peak efficiency.
